

How does BBW spread?

1. Insects can spread BBW

Insects like stingless bees pick up BBW when they visit a sick plant. Later, when the bees go to the male bud of a healthy plant, it becomes sick.

2. Tools can spread BBW

Tools like knives and hoes pick up BBW when cutting a sick plant. Later, when the tools are used on healthy plants, the plants will become sick.

3. Suckers can spread BBW

BBW spreads when sick suckers are planted in new gardens. Only use suckers from healthy areas when planting.
